

TRACKMARKET

A focused product roadmap

Trust first. Explain market impact. Earn daily use.

A concise execution plan distilled from the supplied October 2026 research report and the reviewed source code.

THE STRATEGIC BET

Become the trusted explanation layer that connects a market event to its mechanism, exposed Indian sectors or companies, supporting evidence, uncertainty and a useful alert.

The decision

TrackMarket already has broad surface area: news, quotes, IPOs, events, policy, geopolitics, search, watchlists and portfolio tools. The next milestone is to make one repeatable job reliable: help a user understand why a sourced event may matter to a stock they follow.

FIRST CUSTOMER	NORTH STAR	SEQUENCE
Self-directed Indian investors and traders who follow specific stocks or sectors.	Weekly active users who open a source-backed impact explanation or act on a relevant alert.	Reliability -> evidence-backed explanations -> useful alerts -> retention -> paid validation.

Success is not more screens or more AI summaries. It is users returning because the source is trustworthy, the explanation is useful, and the alert saves them effort.

REVIEW BOUNDARY

This is a source-code and supplied-report review. A full production crawl, live-provider verification and end-to-end deployment check were not completed.

Product review: breadth is here; trust must lead

The strongest opportunity is already visible in the product: connect market news to an understandable, sourced explanation. Several supporting features exist; the main gaps are freshness, proof behind stock links, alert quality and a clear first-use path.

KEEP AND STRENGTHEN	FIX BEFORE EXPANDING
Source-linked Indian and global market news. IPO, policy, event and geopolitical sections. Existing search, watchlist, portfolio and alert foundations.	Show source time and last-checked time; label delayed or stale data. Explain why each sector or ticker is linked to a story. Suppress repeated alerts and tell users why each alert matched. Keep pricing and data claims aligned with what is actually live.

First code improvements prepared

- Public visitors can reach the news and information pages; signed-in-only portfolio and watchlist areas remain protected.
- The home page now states the product value clearly, includes a free-account path, and labels AI summaries and impact tags as estimates.
- Marketing and cancellation copy no longer implies guaranteed accuracy, instant feeds, or paid billing that is not active.
- Scheduled ingestion, ticker refresh, backfill and IPO scan handlers now require a server secret; the scan no longer runs on GET.
- Article Q&A; now requires a verified user token, bounded request size and question length, and a daily per-user quota.

LIVE RELEASE DEPENDENCY

These source changes are prepared locally and are not deployed. Configure the same high-entropy CRON_SECRET in the Lovable server environment and Supabase Vault before applying the scheduled-job migration.

Still to solve in the product

The next engineering work should expose data freshness in the interface, attach evidence to each event-to-stock relationship, measure ticker-mapping accuracy, and make alert delivery understandable and adjustable. Until those foundations are reliable, new dashboards add surface area without building a moat.

The signature experience: a Market Impact Card

Build one structured explanation and reuse it in the feed, company pages, watchlists, briefs and alerts. This is the product that can differentiate TrackMarket from a generic headline feed.

1 EVENT	2 MECHANISM	3 EXPOSURE	4 EVIDENCE	5 UNCERTAINTY	6 ALERT
------------	----------------	---------------	---------------	------------------	------------

CARD FIELD	WHAT THE USER SHOULD SEE
Event and source	A deduplicated event, original publisher, source link, published time and time first captured.
Mechanism	A plain-language path such as supply cost, demand, regulation, rates, currency or trade.
Exposure	Potentially affected sectors or companies, labelled direct or indirect, with a reason for each link.
Evidence	The disclosure, source passage or public fact that supports the relationship; preserve conflicting reports.
Confidence and unknowns	High / medium / low with a reason, a relevant time horizon, and explicit missing facts.
Alert action	Why this matched the user's watchlist, what changed, and clear controls to mute or edit the rule.

TRUST RULES

Show the source and data age before the interpretation. Label potential exposure rather than asserting causation. Treat impact scores as a reading priority, not a return forecast. If evidence is weak, show 'not enough evidence' and do not guess.

Data contract to establish before designing more pages

Canonical event ID; publisher and source URL; published_at and captured_at; last_checked_at; source/data status; related ticker or sector; direct/indirect relation; evidence reference; confidence reason; time horizon; model/version; correction history; and alert match reason.

Execution roadmap: days 0-60

Do the work in order. Each stage should leave behind proof that the product became more trustworthy or more useful.

Days 0-30 | Close the trust and reliability gap

WORKSTREAM	DELIVERABLE	DONE WHEN
Security and operations	Configure route secret, apply the migration, add request/cost limits and review ownership controls.	Unauthorised triggers fail; scheduled jobs work with the secret; logs do not reveal it.
Freshness and sources	Show source, published time, captured/checked time and delayed/stale/error states for news, quotes and IPO data.	A user can tell when each data type was last updated and when it is unavailable.
Event quality	Create a canonical event view, deduplicate repeat coverage and make impact sort consistent.	A manual 100-story review shows duplicates and ordering errors are understood.
Mapping accuracy	Label 100 event-to-sector/ticker links with rationale and direct/indirect status.	Report precision by category; suppress unsupported high-impact links.
First-use path	Make public browsing and a first useful example clear; ask new users to follow symbols or sectors and configure one alert.	A new user can follow a story and understand an alert in a short mobile session.

GATE TO CONTINUE

Do not scale alerts or market claims while high-impact ticker links are unsupported or stale data is presented as current.

Days 31-60 | Ship the repeat-use loop

BUILD	USER VALUE	MEASURE
Market Impact Card v1	Explain the event, mechanism, exposure, evidence, uncertainty and time horizon.	Moderated users can explain why a story may matter; record useful / wrong / unclear feedback.
Alert centre	Symbol, keyword, sector and IPO alerts with quiet hours, duplicate suppression and edit/mute controls.	Useful ratings, duplicate rate, mute rate and alert opens.
Daily Market Brief	Summarise overnight drivers, India pre-open events and items matching a user's watchlist.	Opt-in, open, return and unsubscribe reasons.
Sourced IPO and policy detail	Separate exchange/government/issuer facts from commentary; label unavailable fields.	Every displayed fact has a source and date; unknowns stay unknown.

Pilot: recruit 30-50 target users for two weeks. Observe whether they open explanations, configure alerts and return without founder reminders. Triage high-impact errors within one working day.

Days 61-90: validate value before charging

The first paid offer should be simple: Free versus Pro. Test willingness to pay only after users have repeatedly received value from explanations or alerts.

TRACK	NEXT ACTION	GO / NO-GO EVIDENCE
User discovery	Complete 15-20 interviews across new investors, long-term investors and active traders; ask about a recent missed or misunderstood event.	Repeated pain and a specific workflow TrackMarket can improve.
Price discovery	Test a transparent founding Pro offer around INR 149-199/month or INR 1,499-1,999/year. These are hypotheses, not current prices.	Qualified users take a real action, not just say the idea sounds good.
Checkout	Finish provider onboarding, signed webhook validation, idempotency, server-side entitlements, receipts, cancellation and refunds.	End-to-end payment, expiry, cancellation and refund lifecycle passes before money is collected.
Support and corrections	Add in-product reporting for wrong mappings and stale sources, plus status and ownership.	Reports have an owner and high-impact errors are corrected quickly.
Unit economics	Track AI cost per active user, per explanation and per alert, alongside provider and support costs.	Daily generation is bounded and gross margin can be measured by plan.

Operating scorecard

METRIC	DEFINITION / INITIAL GUARDRAIL
North star	Weekly active users who open a source-backed impact explanation or act on a relevant alert.
Activation	Within 24 hours, follow at least 3 symbols/sectors and open an impact detail or configure an alert.
D7 retention	Returning activated users / activated cohort. Treat >20% as an early hypothesis, then recalibrate.
Alert quality	Useful ratings plus duplicate and mute rates. Aim for >70% useful among rated alerts as a pilot target.
Mapping quality	Human-verified correct links among surfaced links, reported by category and impact level.
Freshness	Age since last successful ingest/update by provider; define separate thresholds for news, quotes and IPOs.
Trust and cost	Wrong-link reports per 1,000 cards, time to correction, AI spend per user and request-limit events.

PAUSE THE PAYWALL IF

Users do not return, source freshness is hidden, unsupported links are common, alerts are muted as noise, or actual payment fulfilment and cancellation cannot be verified.

Monetisation and growth: earn the upgrade

Keep essential public facts and source links visible. Charge for depth, personalisation and workflow once they are reliable.

FREE	PRO - ONLY AFTER VALIDATION
Useful headlines and original source links. Basic tags with uncertainty visible. Basic IPO, policy and event information. Clear data-delay and stale labels. A sample impact explanation and a small number of saved items.	Full evidence-backed impact explanation. Saved watchlists and custom alert rules. Personalised daily brief. Longer event history and saved filters. Higher AI/alert limits with cost controls.

Growth loops worth testing

CHANNEL	EXECUTION	SUCCESS SIGNAL
Daily brief	A concise India-open brief with sourced global drivers, India events and freshness.	Opt-in readers return; unsubscribes stay low.
Shareable event cards	Event -> potential India exposure -> evidence -> uncertainty, with the source link.	Referrals become activated users, not just views.
Search and education	Build a small set of useful event, sector and IPO explainers; avoid thin auto-generated pages.	Organic engaged visits and source/impact interactions.
Communities	Demo the workflow with investor groups and finance educators; avoid spam and prediction claims.	Activation and 30-day retention by cohort.
Partnerships	Explore newsletters, creators or fintech embeds after content and data rights are clear.	A repeat use case, named owner and viable budget.

Keep later products behind demand gates

- Trader scanner: only after users request multi-condition monitoring and quote freshness can support it.
- Terminal and team features: only after research professionals commit to a defined workflow and budget.
- API and embedded data: only after source redistribution rights, schema stability, uptime and costs are documented.
- Deep financial statements and charting: defer unless interviews show a recurring need that existing specialists do not serve.

ONE COMMERCIAL TEST

Start with one Free plan and one Pro offer. Do not launch a menu of tiers or present an inactive checkout as a paid product.

Guardrails, deferred work and immediate actions

RISK	GUARDRAIL
Incorrect stock link or causal claim	Require an evidence-backed reason, confidence band and correction trail; say 'potential exposure' and abstain when unclear.
Stale data or provider failure	Show the provider and last successful time; label delayed/stale/unavailable; never imply a last-known value is current.
Content and market-data rights	Review each publisher and provider's terms. Public RSS or a free endpoint does not automatically permit commercial redistribution.
Advice and regulatory boundary	Keep the product educational and source-led. Get qualified Indian securities-law advice before selling personalised research or buy/sell calls.
Privacy and payments	Minimise personal data; provide clear purpose and deletion routes. Publish complete price, renewal, cancellation and refund terms before checkout.
AI cost and abuse	Use authentication, quotas, size limits, request limits, caching and spend monitoring. Never allow uncapped public generation.

Do not build now

Broad AI buy/sell signals; a full charting or fundamental-screening suite; a global quote terminal; WhatsApp or Telegram delivery without opt-in and cost controls; enterprise SSO, API billing or team administration before data rights and demand are proven.

Next ten actions

1	Configure CRON_SECRET in Lovable and Supabase Vault; then review/apply the scheduled-job migration.
2	Verify public pages load for visitors and portfolio/watchlist routes require sign-in.
3	Add source, captured time and stale/delayed states to the feed, quotes and IPO views.
4	Define the event and impact-card data contract before adding more screens.
5	Manually review 100 event-to-sector/ticker mappings and publish the error breakdown internally.
6	Build the impact card with evidence, direct/indirect links, confidence reason and unknowns.
7	Deduplicate alerts and show why every alert matched.
8	Instrument landing -> story opened -> source clicked -> watchlist -> alert -> return.
9	Run 15-20 interviews and a 30-50-person pilot; prioritize observed behaviour.
10	Offer one Pro test only after repeat use and verified payment/cancellation flows.

This focused roadmap is distilled from the supplied 30-page October 2026 report and the reviewed TrackMarket source. Long-range revenue scenarios, broad market sizing and changing competitor prices were left out; the proposed metrics and pricing ranges remain hypotheses to validate.
